Immunosuppressive Diseases

Feline Leukemia Virus (FeLV)
The viral disease attacks the immune system and leaves the cat vulnerable to a host of secondary infections. There is no known relationship between FeLV and leukemia as it occurs in humans. Because the transmission usually occurs through contact with other felines, those cats that live in multi-cat households or are allowed to roam outdoors are particularly at risk.

Clinical signs may include:
- Immune System Suppression
- Chronic Susceptibility to Other Infections
- May Die Within Three (3) Years of Infection

Recommendation: FeLV Test & FeLV Vaccine

Contagious Respiratory Diseases

Feline Calicivirus (FCV)
Calici is a virus that affects the feline upper respiratory system and accounts for approximately 40% of all respiratory diseases in cats. Even if successfully treated, cats infected with FCV can become chronic virus carriers with lifelong clinics signs of sneezing and running eyes.

Clinical signs may include:
- Moderate Fever
- Ulcers
- Blisters on the Tongue

Recommendation: FVRCP (3 in 1) Vaccine

Feline Viral Rhinotracheitis (FVR)
Caused by Feline Herpes Virus 1 (FHV-1), FVR is the most severe and widespread upper respiratory virus to which cats are susceptible, though it is most serious in kittens. Even if successfully treated, FHV can lead to lifelong infection.

Clinical signs may include:
- Moderate Fever
- Coughing
- Sneezing

Recommendation: FVRCP (3 in 1) Vaccine

Gastrointestinal Disease

Panleukopenia
Panleukopenia or feline distemper is a widespread, often fatal disease. Since most cats are likely to be exposed to Panleukopenia in their lifetime, vaccination against this illness is important.

Clinical signs may include:
- Fever
- Depression
- Loss of Appetite

Recommendation: FVRCP (3 in 1) Vaccine

Nervous System Disease

Rabies
This is a fatal viral disease of all mammals including dogs, cats, livestock & humans. Infected wildlife & unvaccinated animals are the source of this virus. Because rabies is a significant health hazard, it is extremely important to vaccinate your pet. In many states & cities, rabies vaccine is required by law.

Clinical signs may include:
- Foaming at the Mouth
- Death

Recommendation: Rabies vaccine

Preventing feline infectious diseases

- Immune System Suppression
- Chronic Susceptibility to Other Infections
- May Die Within Three (3) Years of Infection
- Moderate Fever
- Ulcers
- Blisters on the Tongue
- Appetite Loss
- Discharge From Eyes and Nose
- Abortion in Pregnant Cats
- Fever
- Depression
- Loss of Appetite
- Vomiting
- Diarrhea
- Foaming at the Mouth
